

METHOD AND SYSTEM FOR MANAGING PRODUCT OUTPUT

ABSTRACT

A method and a system for managing product output are proposed, for connecting work
5 partners at different locations of an enterprise through a network to the managing system,
wherein an enterprise can assign an order from a client to a work partner who needs to
increase profits, and allow another work partner to perform product manufacture and output
according to the order. Moreover, after loginning the managing system, work partners at
different locations of the enterprise can accurately monitor and control operation conditions
10 associated with product manufacture, so that the enterprise can effectively manage
distribution and flow of business performances and profits.
